United States Department of Energy

NAME: (Optional) Keith Magnus 4/18/96
ADDRESS:
TELEPHONE: ( )

Having publicly advertised and disclosed the quantities of weapons-grade plutonium that are stored at the various sites in the US, why not complete the picture by disclosing & issuing road maps that would identify the special building/facility in which the quantities are located. This information along with the "keys" & the storage "bins" would make the material more accessible to terrorist or other similar groups & that are disposed & the use of these materials. After all you have already disclosed or solved at least 90% of the problem of acquiring this mat'l - why not complete the disclosure by providing the remaining approx 10% of the problem.

The terrorist type groups have already & thanked you for your disclosure — they would bless you for the remaining info

The Secretary's February 6, 1996, Openness Initiative announced the locations and quantities of surplus weapons-usable fissile materials. This announcement was to provide the general public with information which DOE could use in reviewing the proposed departmental actions and provide informed input to the decisionmaking process. This announcement was made with full consideration of national security.
